	e.g. linear transformation, coding does not affect coefficient (or recalculate)	dB1 (2)
(e)	0.914 suggests longer spent shopping the more spent. (Idea more time, more spent	B1
	0.178 different amounts spent for same time.	B1 (2)
(f)	e.g. might spend short time buying 1 expensive item <u>OR</u> might spend a long time	
	checking for bargains, talking, buying lots of cheap items.	B1g (1)
		15 marks
(b)	M1 for one correct formula seen, f.t. their $\sum t$, $\sum m$ [Use 1 st A1 for 1 correct, $\sum t$]	2 nd A1 for 2 etc]
(c)	M1 for attempt at correct formula, $\frac{2485}{\sqrt{2101 \times 5478}}$ scores M1A0A0	
	A1ft f.t. their values for S_{tt} etc from (b) but don't give for $S_{tt} = 5478$ etc (see all	oove)
	Answer only (awrt 0.914) scores 3/3, 0.913 (i.e. truncation) can score M1A1ft by i	mplication.
(d)	2 nd B1 dependent on 1 st B1 Accept $\sum m = 261, \sum m^2 = 8541, \sum tm = 6725 \rightarrow 0.914$	
(e)	One mark for a sensible comment relating to each coefficient	
	For 0.178 allow "little or no link between time and amount spent". Must b	e in context.
	Just saying 0.914 is strong +ve correlation between amount spent and time	shopping and
	0.178 is weak correlation scores B0B0.	
(f)	B1g for a sensible, practical suggestion showing that other factors might affect t	the amount spent.
	E.g. different day (weekend vs weekday) or time of day (time spent queuin	g if busy)
