Monopoly Dice - Red and Blue
Blue

| $*$ |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Red |  | 1 | 2 | 3 | 4 | 5 |
|  | 6 |  |  |  |  |  |
|  | 2 | 3 | 4 | 5 | 6 | 7 |
|  | 3 | 4 | 5 | 6 | 7 | 8 |
| 3 | 4 | 5 | 6 | 7 | 8 | 9 |
| 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| 5 | 6 | 7 | 8 | 4 | 10 | 11 |
| 6 | 7 | 8 | 9 | 10 | 11 | 12 |

36 passible physical outcomes
A red 1 and a blue 2 is not the same outcome as a red 2 and a blue 1 .

Probability
 Table Probability $\frac{1}{36} \frac{2}{36} \frac{3}{36} \quad \frac{4}{36} \frac{5}{36} \frac{6}{36} \frac{5}{36} \frac{4}{36} \frac{3}{36} \frac{2}{36} \frac{1}{36}$

Find when you roll the two monopoly dice

1) $\operatorname{Prob}$ (Even scose) $=\frac{18}{36}=\frac{1}{2}$
2) $\operatorname{Prob}$ (Score is prime) $=\frac{15}{36}=\frac{5}{12}$
3) $\operatorname{Prob}(S c o r e>7)=\frac{15}{36}$
4) $\operatorname{Pros}($ Score a multiple of 3$)=\frac{12}{36}=\frac{1}{3}$
5) $\operatorname{Prob}\left(\right.$ Score same on each die) $=\frac{6}{36}=\frac{1}{6}$

Multiplying the Scores on the Dice

| $x$ | 1 | 2 | 3 | 4 | 5 | 6 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 1 | 2 | 3 | 4 | 5 | 6 |
| 2 | 2 | 4 | 6 | 8 | 10 | 12 |
| 3 | 3 | 6 | 9 | 12 | 15 | 18 |
| 4 | 4 | 8 | 12 | 16 | 20 | 24 |
| 5 | 5 | 10 | 15 | 20 | 25 | 30 |
| 6 | 6 | 12 | 18 | 24 | 30 | 36 |

Which score has highest probability?

$$
P(12)=\frac{4}{36}=\frac{1}{9} \quad \begin{aligned}
& 2 \times 6 \\
& 6 \times 2 \\
& 3 \times 4 \\
& 4 \times 3
\end{aligned}
$$

Subtract smaller score from larger score

| - | 1 | 2 | 3 | 4 | 5 | 6 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 0 | 1 | 2 | 3 | 4 | 5 |
| 2 | 1 | 0 | 1 | 2 | 3 | 4 |
| 3 | 2 | 1 | 0 | 1 | 2 | 3 |
| 4 | 3 | 2 | 1 | 0 | 1 | 2 |
| 5 | 4 | 3 | 2 | 1 | 0 | 1 |
| 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Which score has highat probability and what is it?

$$
P(1)=\frac{10}{36}=\frac{5}{18}
$$

Independent Events and the 'AND' Rule

Spinning a coin multiple times
Each spin is independent of the others and the prob of obtaining a Head remains at $\frac{1}{2}$

What is the probability of 3 successive heads

$$
\begin{aligned}
& \text { HHH } \\
& \text { HOT } \\
& \text { HTH }
\end{aligned} \quad P(H H H)=\frac{1}{8}
$$

HT t
TH H
TH

$$
\begin{array}{ll}
\text { TTH } \\
\text { TNT } & P(H H+1)=\frac{1}{2} \times \frac{1}{2} \times \frac{1}{2}
\end{array}
$$

More generally if two events $A$ and $B$ are independent then

$$
P(A, B)=P(A) \times P(B)
$$

In other words the probability of two independent events happening is obtained by multiplying their individual probabilities together

Eg Roll a die and spin a coin
what is the prob of obtaining a 5 and a Head

$$
\begin{array}{llll} 
& & P(5)=\frac{1}{6} & P(H)=\frac{1}{2} \\
H 1 & T 1 & P(5 \cap H)=\frac{1}{6} \times \frac{1}{2}=\frac{1}{12} \\
H 2 & T 2 & P\left(S_{n} H\right)=\frac{1}{12} \\
H 3 & T 3 & T 4 & \\
H 4 & T 5 & &
\end{array}
$$
